(19890411)

AB- PURPOSE: To develop an excellent attenuation characteristic, and to provide with a high vibration isolation performance in which the temperature dependency of the attenuation characteristic has been improved, and further to simplify the structure, by mixing, in a viscous fluid, at least a kind of resin whose glass- transition temperature is within the range of working temperatures.

CONSTITUTION: Both ends of a cylindrical rubber body 2 are closed with fittings 4 and 6 to fill a prescribed viscous fluid 8 in the closed fluid housing space, and a prescribed resin 10 whose glass-transition temperature is within the range of working temperatures is mixed in the viscous fluid. Thus, an excellent attenuation characteristic can be developed, and a high vibration isolation performance in which the temperature dependency of the attenuation characteristic has been improved can be provided. Since the vibration attenuation performance can be improved only by mixing a prescribed resin, it is not necessary to provide a special mechanism. Accordingly, it is possible to simplify the structure as a vibration isolation system, enabling it to be applicable to even small size products, and further enabling the manufacturing man-hour and the number of parts to be reduced and an inexpensive system to be constituted.
